

Prompt file

1. Explain the overall process and logic of building a Hostel Management System with student, warden, and admin roles.
2. Explain how authentication and role-based access control works in a full-stack application.
3. Explain the process of OTP-based verification using mobile number, including expiry and validation logic.
4. Explain how to design a student dashboard and what modules should be included.
5. Explain the logic behind attendance tracking, daily marking, and percentage calculation.
6. Explain how room allocation works with capacity management and constraints.
7. Explain the workflow of outing request system:
student request → warden approval → pass generation.
8. Explain how to generate and validate outing passes using QR codes.
9. Explain the concept and logic of food token system and how QR-based verification works.
10. Explain how complaint management systems work with ticket creation and status updates.
11. Explain how to make a web application responsive using CSS (Flexbox/Grid).
12. Explain how dark/light theme works and how to apply it globally.
13. Explain strong form validation rules for email, password, and phone number.
14. Explain how backend validation works and why it is important.
15. Explain common debugging techniques for fixing API and data flow issues.
16. Explain how to handle edge cases like empty data, invalid input, and server errors.
17. Explain how to integrate charts for dashboard analytics (attendance visualization).
18. Explain how to improve user experience with loading states and smooth transitions.
19. Explain how to structure a Node.js project (models, controllers, routes).
20. Explain how to secure user data and prevent duplicate entries.
21. Explain how to optimize API calls and avoid unnecessary requests.
22. Explain how localStorage works and how to store user preferences like theme.
23. Explain how to design a settings page and manage user preferences.
24. Explain how sidebar navigation and active state logic works.
25. Explain how to prepare a project for deployment (environment variables, cleanup).

Note: All prompts were used only to understand the process, logic, and concepts.

The complete implementation, coding, and testing were done independently.
